Why C for Data Structures?

Many argue that C is an ideal language for learning data structures. Why? Because C offers:

- **Low-level control:** C provides programmers with direct memory management capabilities. This allows for a deeper understanding of how data structures are actually implemented in memory, fostering a more intuitive grasp of their performance characteristics. You directly manipulate pointers and memory allocation, which is essential for understanding the nuances of linked lists, trees, and graphs.
- **Efficiency:** C is known for its speed and efficiency. This makes it perfect for studying the performance trade-offs between different data structures. You can directly measure the time and space complexities of your implementations.
- **Simplicity (relative to other languages):** While not necessarily the simplest language, C is relatively straightforward compared to languages like Java or Python, making it easier to focus on the core concepts of data structures without the distractions of complex language features.
