FAQ

Q1: What is the difference between ISDN BRI and PRI?

A1: BRI (Basic Rate Interface) is a low-bandwidth ISDN connection typically offering two B-channels (64 kbps each) and one D-channel for signaling. PRI (Primary Rate Interface) offers significantly higher bandwidth, commonly with 23 B-channels and one D-channel. ViewStation systems predominantly use BRI connections due to their simpler setup and lower bandwidth requirements.

Q2: Can I use a standard phone line with ViewStation ISDN?

A2: No, ViewStation ISDN systems are specifically designed for ISDN lines and cannot operate with standard analog phone lines. They require the digital signaling and bandwidth provided by an ISDN connection.

Q3: What kind of codecs are typically used with ViewStation ISDN?

A3: The specific codecs depend on the ViewStation model and configuration. However, common codecs used in ISDN video conferencing systems include H.261 and H.263, which are optimized for the lower bandwidth of ISDN BRI lines.

Q4: How can I upgrade the firmware of my ViewStation ISDN system?

A4: Firmware upgrades are typically handled through a dedicated interface on the ViewStation's central unit. Consult your specific ViewStation ISDN user guide for detailed instructions on the upgrade process. Incorrectly upgrading the firmware can damage the system, so proceed with caution.
