Successfully implementing the Edwards EST system requires proper training and a comprehensive understanding of the associated procedures. The **Edwards EST quickstart manual** acts as the cornerstone of this learning process. However, practical application extends beyond theoretical knowledge.

Here's a simplified, illustrative sequence of steps often involved in a TAVR procedure using the Edwards EST system (this is a simplified representation, and specific steps may vary based on the individual case and the specific Edwards EST system being used):

1. **Pre-Procedural Planning:** Careful patient selection and pre-procedural planning are crucial. This includes a thorough assessment of the patient's anatomy, risk factors, and overall health.
2. **Vascular Access:** A small incision is made to gain access to the femoral artery or other appropriate vascular access site.
3. **Catheter Insertion and Deployment:** The Edwards EST catheter is carefully advanced through the vascular access site into the aorta.
4. **Valve Delivery and Deployment:** The new aortic valve (e.g., SAPIEN 3) is deployed precisely within the native aortic valve using the Edwards EST system's features.
5. **Post-Deployment Assessment:** Real-time imaging is used to assess the deployed valve's position and function.
6. **Sheath Removal and Closure:** Once the valve is securely deployed, the catheter is carefully withdrawn, and the access site is closed.
7. **Post-Procedure Monitoring:** The patient is closely monitored for any complications and to assess the effectiveness

of the procedure.

It is essential to consult the official **Edwards EST quickstart manual** and complete the prescribed training program for detailed instructions and to address specific procedural steps and potential complications.
