### Section 2: Multiple Choice Questions and Answers: A Sample

Let's delve into some example multiple-choice questions that challenge your advanced accounting acumen. Remember, the trick is not just to identify the right answer, but to truly grasp why it is correct and why the others are not.

**Question 1:** A company uses the equity method to account for its investment in another company. How is the investment recorded on the investor's balance sheet?

- a) At current value
- b) At acquisition cost
- c) At cost, adjusted for the investor's share of the investee's net income and dividends
- d) At realization value

**Answer: c) At cost, adjusted for the investor's share of the investee's net income and dividends.** The equity method reflects the investor's share of the investee's net assets. Therefore, the investment is initially recorded at cost and then adjusted each period for the investor's share of the investee's net income (increasing the investment) and dividends (decreasing the investment). Options a, b, and d are incorrect because they do not reflect the principles of the equity method.

**Question 2:** What is the primary purpose of a deferred tax debt?

- a) To reflect for future tax reductions
- b) To record for the difference between taxable income and financial statement income
- c) To account for taxes settled in previous years
- d) To reflect for penalties related to fiscal statements

**Answer: b) To reflect for the difference between taxable income and financial statement income.** A deferred tax liability arises when a company reports higher income on its financial statements than its taxable income. This difference can occur due to temporary timing differences in the recognition of revenues and expenses. Option a describes a deferred tax asset. Options c and d are irrelevant to the definition of a deferred tax liability.

**Question 3:** Which of the following is NOT a characteristic of a merged financial statement?

- a) It presents the financial position of a parent company and its subsidiaries as a single economic entity.
- b) It removes intercompany transactions.
- c) It always shows a higher level of earnings than the individual companies' financial statements.
- d) It provides a more complete picture of the overall financial health of a corporate group.

**Answer: c) It always shows a higher level of earnings than the individual companies' financial statements.** While consolidation often provides a more comprehensive view, the consolidated net income is not automatically higher. Intercompany transactions are eliminated, which can impact the overall numbers. Options a, b, and d accurately reflect the features of consolidated financial statements.
